2. Reflection Questions

1. Did your estimations reflect the actual effort? Yes, the estimations were relatively accurate for a simulated environment. We used the Fibonacci sequence to assign story points, reserving higher points (like 5) for complex tasks that involved backend logic (such as analyzing transaction logs or building cancellation guides), and lower points (like 2 or 3) for straightforward UI or database update tasks. Because the work was broken down into manageable user stories within our Epics, the estimated effort aligned well with the complexity of the requirements.

2. Was your backlog well-prioritized? The backlog was effectively prioritized based on core functionality versus secondary features. Tasks critical to the system's primary value—such as identifying subscriptions (Story 1.1) and calculating the burn rate (Story 1.2)—were assigned High priority. Secondary quality-of-life features, such as manually marking false positives (Story 1.3) and the one-click cancellation guide (Story 2.2), were assigned Medium priority. This ensured that the most valuable features would be tackled first if time became a constraint.

3. How did your simulated sprint align with your plan? The simulated sprint aligned perfectly with the initial plan. Because the Epics and User Stories were directly derived from the Lab 1 functional requirements, the scope was clearly defined before the sprint started. All planned user stories were successfully moved from "To Do" to "In Progress" and finally to "Done" within the simulated timeframe, meaning we met our Sprint Goal without any scope creep.

4. What insights did the burndown chart give about your team's capacity? The burndown chart provided a clear visual representation of our remaining work over time. Because all tasks in this simulated sprint were completed successfully, the chart showed a steady downward trajectory toward zero. This indicates that the team's capacity was perfectly matched to the amount of work committed (the total story points) during sprint planning. In a real-world scenario, if the line had stayed flat or dropped suddenly at the very end, it would indicate that we either took on too much work or didn't break our tasks down into small enough pieces.
