1. Requirements Table:

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall analyze transaction logs to identify/ recurring billing patterns and project total monthly subscription expenditure.	High	Pass: Recurring service identified and renewal date logged; Fail: One-time payment misclassified as subscription.	(Given) Core functionality to identify subscriptions.
FR-002	Functional	The system shall send an alert notification to the user 3 days before any identified subscription renewal date.	High	Pass: Notification received exactly 3 days prior to renewal; Fail: No notification or incorrect timing.	Helps users remember to cancel before being charged automatically.
FR-003	Functional	The system shall provide a one-click cancellation guide or direct cancellation link for each identified subscription service.	Medium	Pass: Clicking the link opens the correct cancellation page or guide; Fail: Missing or broken link/guide.	Reduces the effort required for users to cancel unwanted services.
FR-004	Functional	The system shall calculate and display the user's monthly "burn rate" (total fixed costs) based on all active recurring expenses.	High	Pass: Total matches the exact sum of all active subscriptions; Fail: Incorrect sum displayed.	Gives the user clear visibility into their monthly fixed costs.
FR-005	Functional	The system shall allow the user to manually mark an identified recurring charge as "Not a Subscription" to exclude it from future calculations.	Medium	Pass: Marked item is removed from burn rate and no longer triggers alerts; Fail: Item remains in calculations.	Prevents false positives (like a recurring transfer to savings) from skewing data.
NFR-001	Non-Functional	Financial transaction imports (CSV/OFX) must parse securely without storing raw banking credentials in cleartext.	High	Pass: Benchmarking tests confirm target latency and security standards under simulated peak load.	(Given) Protects sensitive financial user data.
NFR-002	Non-Functional	The system dashboard shall load and display the monthly burn rate and upcoming renewals within 2 seconds.	Medium	Pass: Load time is under 2 seconds on a standard connection; Fail: Load time exceeds 2 seconds.	Ensures a smooth fast and responsive user experience.

2. UML Use-Case Diagram:

3. Use-Case Flow:

Use Case Name: Cancel Subscription

Primary Actor: Individual User

Preconditions:

- The user is logged into the app.
- The user has imported their bank transactions.
- The system has identified at least one active subscription.

Postconditions:

- The subscription is marked as "Cancelled" in the system.
- The user's monthly burn rate is recalculated and updated.

Main Success Scenario:

1. The User selects a specific subscription from their active subscriptions list on the Dashboard.
2. The User clicks the "Cancel Subscription" button.
3. The System searches its database and displays the specific "Cancellation Guide" or direct cancellation link for that service.
4. The User follows the guide to cancel the service externally, then returns to the app and clicks "Mark as Cancelled".
5. The System updates the subscription status to "Cancelled" in the database.
6. The System recalculates the monthly burn rate (subtracting the cancelled cost).
7. The System displays a success message and shows the updated burn rate.

Alternate Flow:

3a. Cancellation Guide Not Found

1. The System cannot find a specific cancellation guide or link for the selected service in its database.
2. The System displays a generic message: "We don't have a guide for this service yet. Please visit their website to cancel." and provides a link to a Google search for the service name.
3. The User figures out how to cancel it externally, returns to the app, and clicks "Mark as Cancelled".
4. Return to Step 5 of the Main Success Scenario.
